FROM THIS....

UNTIDY

DIFFICULT TO FIT

PRODUCT BUILD UP ISSUES

	Standard Hose Clamped Flexible Connectors	BFM™ System
HYGIENE	Product building up between the flexible connector and the side wall of the spigot	No crevices for product to get caught in.
SIZING	From inaccuracies in measuring on site through to production, it can be very difficult to get a perfect fit of a hose clamped connector.	PERFECT fit every time.
FITTING	Both the speed and accuracy of fitting hose clamps can vary widely and often clamps are not fitted correctly.	Can only fit in exactly the correct place, i.e. in or out.
EXPLOSION	In an over pressure situation hose clamps are normally always the weakest link and give up or let go long before the flexible connector would be due to rupture.	Only seals tighter under high pressures.
STANDARD SIZES	Current flexible connectors are made any size whatsoever, hence there are thousands of different sizes.	Set standard sizes in 50mm increments helps standardise stock holdings of spare parts.
HEALTH & SAFETY	When using screw drivers to tighten up hoseclips, damage is common to the flexible connector and even the installers hands.	Tool free connector changing, simply snap in with your hands.

BFM™ Specifications

In-line static equipment
IG = CL – 10mm
(Minimum)

Off Set equipment
IG = CL – 20mm
(Minimum)

Oscillating equipment
IG = CL – 40mm
(Minimum)

CL = Connector Length (See BFM™ Flexible Connector Sheet)

- Note:
1. The stainless steel spigots (flanges) have a tail 52mm (2") long. These can be easily cut down or cut on an angle to suit your existing pipework.
 2. It is important to weld the spigots onto your pipework with the length of the flexible connector in mind. Standard length flexible connectors will be stocked and hence will be more readily available, and less expensive than non standard lengths.
